# MultiFit system

is a line of **unique** wide-channel progressive lenses with **soft transitions** between fields of vision. The manufacturing process of these individualised progressive lenses ensures that distortions at the edge of the lens do not exceed the tolerance threshold of human vision. Whatever distortions remain, they are **minimised** and arranged in a way so as to remain imperceptible to the human eye.

**Individualisation** in accordance with the client's personal parameters is the key benefit of these lenses. The manufacture of **individualised progressive lenses** takes into account the following:

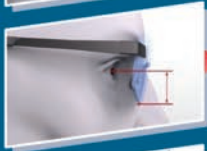

---

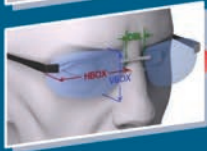

*The client's individual prescription (Rx)*

*The Pantoscopic angle*

*Distance between the pupil and the bottom of the frame*

*Parameters of the frame*

*Distance between pupils*

*Distance between the pupil and the lens*

*Reading zone*

*Curvature angle of the frame*
